

We will use the below sample code (Solution from the previous exercise) and apply COND Operator in the code.

```
DATA: l_tab_doctyp      TYPE RANGE OF esart,
      l_ord_description TYPE string.

l_tab_doctyp = value #( ( sign = 'I' option = 'EQ' low = 'NB' )
                       ( sign = 'I' option = 'EQ' low = 'ZNB' ) ).

SELECT *                "* means get all fields
  UP TO 10 ROWS         "only retrieves 10 rows
  FROM ekko
  INTO TABLE @data(lt_ekko)
  WHERE bsart IN @l_tab_doctyp.

LOOP AT lt_ekko ASSIGNING FIELD-
SYMBOL(<f_ekko>).      "loops around the data in table it_ekko

  WRITE: / |PO number: | && <f_ekko>-ebeln.

  WRITE: | { <f_ekko>-pincr ALPHA = OUT } |.

  IF <f_ekko>-bsart = 'NB' AND <f_ekko>-waers = 'USD'.
    l_ord_description = 'Standard Order in United States'.
  ELSEIF <f_ekko>-bsart = 'NB' AND <f_ekko>-waers = 'EUR'.
    l_ord_description = 'Standard Order in Europe'.
  ELSEIF <f_ekko>-bsart = 'NB'.
    l_ord_description = 'Standard Order - Others'.
  ENDIF.

  WRITE: l_ord_description.

ENDLOOP.
```
